VAT +++

Scouting cams are used for the unnoticed observation and surveillance of wild animals such as deer, wild boar, foxes and the like, both day and night. In addition, a wildlife camera can also be used to monitor property, company premises or property protection. Braun Photo Technik is expanding its extensive range of game cameras with the new, ultra-light Braun Scouting Cam Black200 WiFi Mini. As the name suggests, the Black200 WiFi Mini stands out with its small dimensions of only 110 x 90 x 56.5 (HxWxD) mm, its very low weight of only 172 grams and the integrated WiFi module. The WiFi module enables a direct connection from the camera to the smartphone. In order to connect to the camera, you must be within range of the camera's Bluetooth or WiFi signal. The range is approx. 10 meters with Bluetooth and approx. 20 meters with WiFi. The camera's WiFi signal can be activated via Bluetooth. The recordings can be viewed, downloaded and deleted using the free app. The annoying removal of the memory card is no longer necessary. The app also enables a live preview with the option of manual image and video recording. In addition to convenient data transfer, the system settings of the wildlife camera can also be managed using the WiFi connection and app. The exact resolution of the photos and videos, as well as numerous other parameters, can be set via the connected smartphone and the app. The high-quality 2 MP CMOS image sensor used delivers very good color images during the day. The new Scouting Cam Black200 WiFi Mini also delivers videos with a length of up to ten minutes and a resolution of 1520p (20fps) or 1080p (30fps). As soon as daylight fades, the black infrared LEDs are activated and illuminate the scene. For technical reasons, all recordings are then recorded at night in black and white, with the maximum night vision being 15 meters at night. The trigger time is only 0.6 seconds. Braun supplies the Scouting Cam Black200 WiFi Mini in a robust housing and with a PIR motion detector with a detection radius of 90° and 22 black IR LEDs (850nm) for night shots. The compact and waterproof camera housing meets protection class IP65. The Braun Scouting Cam Black200 WiFi Mini has a 2" color TFT display for image control of the recordings, which are stored on a micro SD card (up to max. 32GB, AVI and JPG format). Useful time-lapse recordings (video or photo) are also possible with the new game camera. The operating temperatures range from -20 degrees to +65 degrees. In addition, the Braun Scouting Cam Black200 WiFi Mini has an integrated microphone, password protection and the date, time, moon phase and temperature. It is powered by four AA batteries and the standby time is around six months. The scope of delivery also includes a tree mount and a fastening strap to fix the camera to a tree. Alternatively, it can also be placed independently on a tripod or with a tree screw. The Braun Scouting Cam Black200 WiFi Mini will be available from the end of February 2023 at an RRP of EUR 99.90 including VAT.
